

With the help of a DLL in WoW's process Octopus can broadcast mouse movements to multiple instances per client. This feature has been around for 6 months or so with reports of banning or such. Please see <http://www.dual-boxing.com/wiki/index.php/Octopus> for more information on DLL injection.

### Multi window cursor broadcast:

Changes the default behaviour of broadcast clicks. It requires cursor broadcast to be switched on to do so.

Any window with [c] on it will receive the broadcast cursor positions, and clicks simultaneously.

Please test standard click broadcasting before configuring this.

### Prevent deactivation

With focus follows mouse on this has no benefit, but it's an alternative. When you focus another window outside of WoW... it will not deactivate quite like before :-), allowing you to return to the window and click ingame with a single click.

This option should work on any program.
